TicTacBroke

TNTech CSC2510 Lab4

I need help with a program! I'm really enjoying working with AI, and I wanted to play TicTacToe with AI during our breaks. We (AI and I) actually collaborated on the project together. The AI was good… a little too good… so I started trying to make the AI easier to beat. The more I modified the code, the more I lost. I thought I had the program figured out initially, but now the program is broken ☹ Can you please help with the following issues I've identified:

- I can't get the script to run with license information provided.
- The board doesn't print correctly.
- Neither player can win by filling the bottom row.
- It doesn't always display the correct player's move between turns.
- Even if I get three in a row, I still can't win!?

Rubric

- 60pts for submission in iLearn
  - Download code from Github
  - Get a screenshot of your final version of running code
  - Zip and submit the code, screenshot, and files required to run the script
- 10pts for including a screenshot of the finished code in your own GitHub repository with a visible link inside the submitted zip
  - The link will be tested and must be operational
  - The actual requirement is to store your files on GitHub
- 5pts per bug squashed (there are 6 lines that can be modified per the given issues to get the code to a fully operational state)
- Code alterations outside the requested help will result in a deduction of points

And don't modify the AI, as that might make it even more angry!!! Just fix the issues above. Think through good troubleshooting skills you've learned this semester and in other classes. Add echo statements to assist in finding where the code is breaking. And good luck!

I've shared the code and additional files on GitHub for you download:

https://github.com/regis-billings/TicTacBroke

Go to the site and download the files to your local system to modify and fix. When you're done, create a new repository of your own on GitHub to store the script and required files. Maybe future generations will learn how to harness the power of our TicTacToe AI for the betterment of humanity!

Additional Rules:

- You must adhere to licensing
    - You may not bypass the license or README requirement inside the script
    - you may not alter the license file or its content
    - woe be to those who do not heed warning in the README
- Grid must look like the following:

```
 1 | 2 | 3
---+---+---
 4 | 5 | 6
---+---+---
 7 | 8 | 9
```

- The player should be able to win, and the AI should be able to win
- You should address as many issues as possible
